

How To Disable DNS-over-HTTPS (DoH) in Major Browsers

This guide explains how to disable DNS-over-HTTPS (DoH) in Microsoft Edge, Safari, Firefox, and Chrome. Disabling DoH ensures your computer uses your network's default DNS servers, which may be necessary for local filtering or troubleshooting.

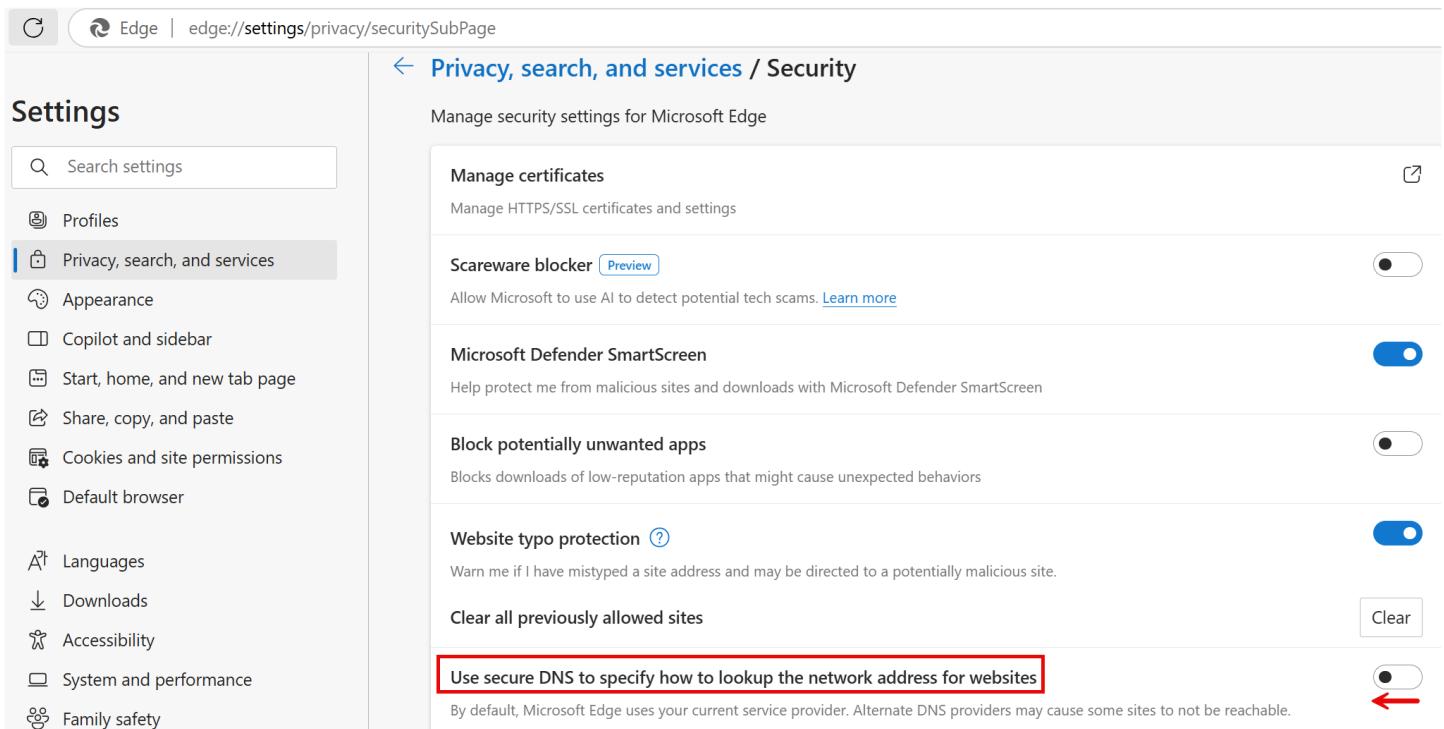

Microsoft Edge

1. Open Microsoft Edge.
2. In the address bar, type: `edge://settings/privacy`

The screenshot shows the Microsoft Edge settings page. The address bar displays `edge://settings/privacy`. The left sidebar lists various settings categories: Profiles, Privacy, search, and services (which is selected and highlighted with a blue bar), Appearance, Copilot and sidebar, Start, home, and new tab page, Share, copy, and paste, Cookies and site permissions, Default browser, Languages, Downloads, Accessibility, System and performance, and Family safety. The main content area is titled "Privacy, search, and services" and contains sections for "Clear browsing data", "Typo protection", "Clear browsing data on close", and "Tracking prevention". Below these are sections for "Tracking prevention", "Clear browsing data", "Privacy", and "Security". The "Security" section is highlighted with a red box.

3. Scroll to the **Security** section.
4. Find 'Use secure DNS to specify how to lookup the network address for websites'.

The screenshot shows the Microsoft Edge security settings page. The address bar displays `edge://settings/privacy/securitySubPage`. The left sidebar is identical to the previous screenshot. The main content area is titled "Privacy, search, and services / Security" and contains sections for "Manage certificates", "Scareware blocker" (with a "Preview" button), "Microsoft Defender SmartScreen", "Block potentially unwanted apps", "Website typo protection" (with a question mark icon), and "Clear all previously allowed sites". At the bottom, there is a section titled "Use secure DNS to specify how to lookup the network address for websites". This section is highlighted with a red box and a red arrow points to the switch, indicating where to turn it off.

5. Turn the switch Off.

1. Open Chrome.

2. In the address bar, type: chrome://settings/security

chrome://settings/security

About Chrome

Standard protection

Protects against sites, downloads, and extensions that are known to be dangerous. When you visit a site, Chrome sends an obfuscated portion of the URL to Google through a privacy server that hides your IP address. If a site does something suspicious, full URLs and bits of page content are also sent.

No protection (not recommended)

Does not protect you against dangerous websites, downloads, and extensions. Your Safe Browsing settings in other Google products won't be affected.

Secure connections

Always use secure connections

For sites that don't support secure connections, get warned before visiting the site

Advanced

Warn you if a password was compromised in a data breach

When you use a password, Chrome warns you if it has been published online. When doing this, your passwords and usernames are encrypted, so they can't be read by anyone, including Google.

Use secure DNS

Make it harder for people with access to your internet traffic to see which sites you visit. Chrome uses a secure connection to look up a site's IP address in the DNS (Domain Name System).

3. Scroll to the section labeled 'Use secure DNS'.

4. Turn the switch/select Off.

Mozilla Firefox

1. Open Firefox.
2. In the address bar, type: `about:preferences#privacy`

The screenshot shows the Mozilla Firefox settings page with the URL `about:preferences#privacy` highlighted in the address bar. The 'DNS over HTTPS' section is highlighted with a red box. The 'Enable secure DNS using:' section is also highlighted with a red box, specifically the 'Off' option.

DNS over HTTPS

Domain Name System (DNS) over HTTPS sends your request for a domain name through an encrypted connection, creating a secure DNS and making it harder for others to see which website you're about to access.

[Learn more](#)

Status: Off [Learn more](#)

Firefox won't use secure DNS on these sites [Manage Exceptions...](#)

Enable secure DNS using:

- Default Protection**

Firefox decides when to use secure DNS to protect your privacy.
- Increased Protection**

You control when to use secure DNS and choose your provider.
- Max Protection**

Firefox will always use secure DNS. You'll see a security risk warning before we use your system DNS.
- Off**

Use your default DNS resolver

3. Scroll down to the 'DNS over HTTPS' section.
4. Under 'Enable secure DNS using:', select 'Off'.

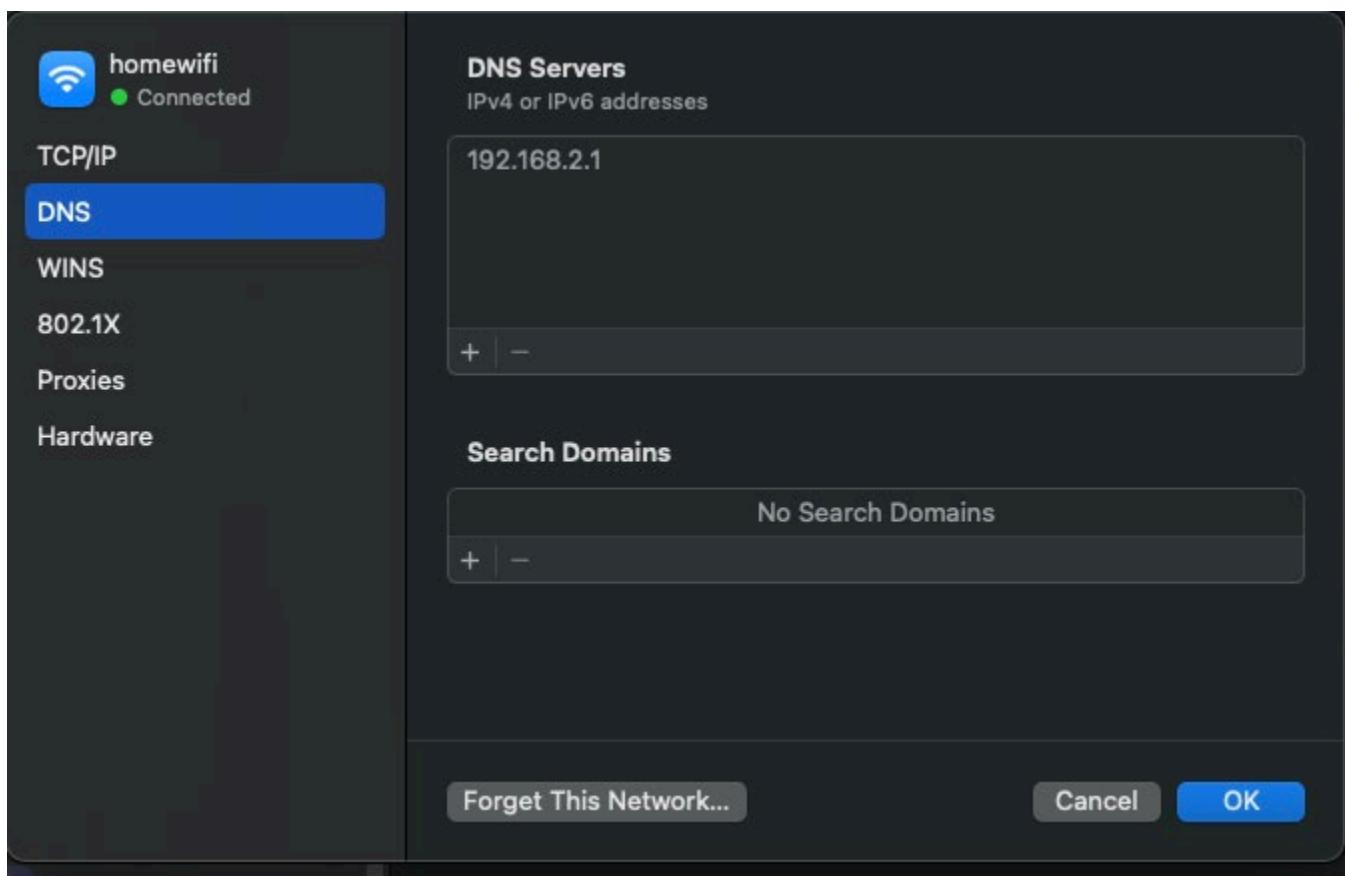

Safari (on macOS)

Safari uses your Mac's system DNS settings.

1. Click the Apple menu -> System Settings.
2. Go to Network and choose your connection (e.g., Wi-Fi).

3. Click Details -> go to the DNS section.

4. If you see DNS servers like 'dns.google' or 'cloudflare-dns.com', remove them.

How to Check if It Worked

1. Open your browser.
2. Visit: <https://1.1.1.1/help>
3. Look for the line: 'Using DNS over HTTPS (DoH): No' - If it says No, you're all set!
